

Some Chest Beating

*Austravel SafetyNet
has a good reason to blow the trumpet.*

During the creation of the AustravelSafetyNetwork, there have been a number of significant technical developments and milestone achievements applied to HF radio.

Many achievements have lead to a monopoly on operational features which provide a high grade of operational service.

1. We are the largest HF network in Australia to be licensed for mobile to mobile to base, including telephone, direct dial connect and general communication traffic.
2. We are the only network to utilise the RED button to broadcast in parallel to all bases an emergency call.
3. We are the only network to accept GPS information when transmitted automatically in an emergency call, which is then displayed to Incident responders directly.
4. We are the only network to have Member Information Text Input by members about their travels, which is included in emergency messages, to help responders respond appropriately.
5. We are the only network to have Incident Responders to assist with general HELP or linking to other emergency first responder services.
6. We are the only network to bridge the usage of smartphones to HF, providing GPS locations on google maps on mobile devices, including bi-directional text messaging from phone to mobile HF radio.
7. We are the only network to use solar power on our new base sites, and we are totally immune to area power failure while the mobile phone network remains operational. Not to mention the low carbon footprint.
8. We are the only network to use battery backing on all base sites. The batteries provide a minimum of 24 hours continuous operation of that base, should the power fail.
9. We are the fastest growing HF radio service provider in Australia, offering even more features than those listed above.
